CTS Log Collector

CTS Log Collector is an additional software for [Dummy](). It connects to CTS basestation via TCP to logging ports and forward log entries to locally installed dummy.

The need

CTS Log Collector does following important things:

- gets GSSI attachments (Scan List) information from logs and passes to the core - required to manage group routing (no such data in signalling)
- passes log to logging server to simplify analysis of issues

Configuration

```
# [IP of basestation] [dummy instance name] [basestation ID (1-8)]
COMMAND_ARGUMENTS=10.0.0.1 default 1
```
